

Landing Page — Animation Specification

Developer handoff document · UI Motion Design

This document covers the scroll and entrance animations for the Creasume landing page, section by section, top to bottom.

1. Hero Section

REFERENCE: The Hero Section — including the demo card — should be identical to the Waitlist page Hero Section. Reuse the Waitlist page's hero animation 1:1 (entrance timing, easing, demo card behaviour). No new screenshot for this section; refer to the Waitlist page implementation directly.

2. Component Screenshot

Reference for the sections below: the scrolling stat marquee, the 4-stat info card, and the 'Hear from Our Influencers' testimonials heading with placeholder cards.

Figure 1 — Marquee bar, stats card, and testimonials heading

3. Marquee Bar — Constant Left Slide

The top bar containing 'Real Metrics · One Link · Professional Identity · Verified ...' scrolls continuously to the left, looping infinitely. This is an ambient, always-on animation — not scroll-triggered, it runs from page load and never stops.

Animation Details

- Direction: continuous horizontal slide to the LEFT.
- The text/dot sequence ('Real Metrics · One Link · Professional Identity · Verified ...') must be duplicated at least twice in the DOM, placed back-to-back, so the loop has no visible seam.
- Technique: `translateX(0%) → translateX(-50%)` on the duplicated content track, animation: `marquee 25s linear infinite`.
- Speed: roughly 25–30 seconds per full loop — slow and ambient, not attention-grabbing.
- Easing: linear (constant speed throughout, no ease-in/out — this is a continuous ticker).
- On hover: optionally pause the marquee (`animation-play-state: paused`) so users can read it; resume on mouse leave.
- This animation does not need a scroll trigger — start it immediately on page load since it sits in the hero/top area of the page.

4. Stats Card — Dynamic / \$250 Billion / 3 Minute / Verified

REFERENCE: This card's entrance animation should match the equivalent stats card on the Waitlist page exactly. Reuse that animation 1:1 — same entrance direction, duration, and easing.

What this section contains (for reference)

- A single dark pill-shaped card divided into 4 segments: Dynamic / Professional Link, \$250 Billion / Creator Economy, 3 Minute / Setup, Verified / Creator Profiles.
- Each segment has a bold white headline and a smaller pink/magenta sub-label underneath.
- Refer to the Waitlist page codebase for the exact entrance keyframes, duration, and stagger (if any) between the 4 segments.

5. “Hear from Our Influencers” — Slow Right Slide

The testimonials heading block ('Hear from Our Influencers' + the subtitle line beneath it) has a slow, continuous sliding animation to the right. Like the marquee, this is an ambient looping motion rather than a one-time scroll entrance.

Animation Details

- Direction: continuous slide to the RIGHT (opposite direction to the marquee bar above it, for visual contrast between sections).

- Apply this to the heading + subtitle as a single grouped block, not as two separate animations.
- Technique: same duplicated-content marquee approach as Section 3, but reversed — $\text{translateX}(-50\%) \rightarrow \text{translateX}(0\%)$, or simply animate in the positive X direction.
- Speed: slower than the top marquee — roughly 35–40 seconds per loop, since this is described as a 'slow' slide, distinctly calmer than the top bar.
- Easing: linear (constant speed, continuous ticker-style motion).
- Trigger: since this section sits further down the page, trigger the start of this looping animation when the section scrolls into view (IntersectionObserver, threshold 0.15), rather than running it from page load like the hero marquee.
- Once triggered, it loops indefinitely for as long as the section is mounted — it does not need to pause when scrolled out of view, though pausing off-screen is acceptable for performance (animation-play-state toggle).

6. Connect Instagram / Three Steps / Made For / Built For Section

This covers the full scrolling block containing: the 'Your consent matters to us' bar, the 'Three steps to your verified creator identity' stepper, the COLLABORATE / ENGAGEMENT marquee strip, the 'Made for the next generation of creators' + 'One Professional Link' card, and the 'Built for Emerging Creators' section with the 4 feature cards below it.

Figure 2 — Consent bar, Three Steps, marquee strip, Made For / Built For sections

REFERENCE: All animations in this section — the consent bar entrance, the Three Steps stepper reveal, the COLLABORATE / ENGAGEMENT marquee strip, the 'Made for the next generation of creators' card entrance, and the 'Built for Emerging Creators' heading + 4 feature cards below — should be identical to the equivalent sections on the Waitlist page. Reuse the Waitlist page's animations 1:1 (entrance directions, durations, easing, and any marquee/scroll behaviour) rather than designing new motion for these blocks.

Elements covered by this reference (for dev checklist)

- 'Your consent matters to us' top bar — entrance animation
- 'Three steps to your verified creator identity' heading + 3-step stepper (Connect Instagram → Auto-Generate Identity → Share with Brands) — entrance/reveal animation
- 'Start Now' button — any hover/entrance state
- COLLABORATE • ENGAGEMENT • BRAND marquee strip — scrolling text behaviour
- 'Made for the next generation of creators' text block — entrance animation

- 'One Professional Link' card (with the chain-link icon) — entrance animation
- 'Built for Emerging Creators' heading + supporting paragraph — entrance animation
- 4 feature cards (Smart Media Kits, Creator Profiles, Brand Imprint, Stronger Positioning) — entrance animation, including any stagger between the 4 cards

7. “Brands that Trust Creasume” — Left Sliding Animation

The row of brand logo pills (Spotify, Spotify, Spotify, Spotify...) scrolls continuously to the left, looping infinitely — same ambient marquee pattern used elsewhere on this page.

Figure 3 — Brands marquee, CTA line, pricing cards, Founding Creator grid

Animation Details

- Direction: continuous horizontal slide to the LEFT.
- Duplicate the row of logo pills at least twice back-to-back in the DOM for a seamless loop.

- Technique: `translateX(0%)` → `translateX(-50%)` on the duplicated track, animation: `marquee 22s linear infinite`.
- Speed: ~20–22 seconds per loop — similar pace to the top hero marquee.
- Easing: linear (constant ticker speed, no ease-in/out).
- Trigger: scroll-triggered start (`IntersectionObserver`, threshold 0.15) since this section sits mid-page; pause when off-screen is optional but recommended for performance.
- Optional: pause on hover so users can read individual brand logos, resume on mouse leave.

8. “Your Next Brand Deal Starts Here” — Simple Fade In

Animation Details

- This is a one-time scroll-triggered fade, not a looping animation.
- Start state: `opacity: 0`.
- End state: `opacity: 1`.
- Duration: 500ms.
- Easing: `ease-out`.
- No movement/translate — pure opacity fade only, as requested ('simple fade').
- Trigger: `IntersectionObserver`, threshold 0.2. Fires once when the line scrolls into view.
- The 'Go To Dashboard' button beneath it can fade in immediately after (100ms delay) using the same fade, or appear together with the text — either is acceptable since no stagger was specified.

9. Pricing Section — Pop-Up Entrance + Hover Zoom

The 'Simple pricing. No surprises.' section has 3 pricing cards (Creator ■0, Pro Creator ■199, Premium Creator ■499). They animate in with a pop-up entrance, and each card zooms in slightly on hover, returning to normal size when the cursor leaves.

Entrance Animation — Pop-Up

- Start state: `opacity: 0, scale(0.85)` — card starts smaller and invisible.
- End state: `opacity: 1, scale(1)` — card pops up to its full natural size.
- Duration: 450ms.
- Easing: `cubic-bezier(0.34, 1.56, 0.64, 1)` — slight overshoot past `scale(1)` before settling, giving a bouncy 'pop' feel rather than a flat scale-up.

- Stagger: 120ms between each of the 3 cards (Creator → Pro Creator → Premium Creator, left to right).
- Trigger: IntersectionObserver, threshold 0.15, fires once when the pricing section scrolls into view.
- The Monthly / Annual toggle above the cards can fade in just before the cards (e.g. 100ms head start) using a simple opacity fade.

Hover Animation — Zoom In / Out

- On hover: the hovered card scales up — transform: scale(1) → scale(1.05).
- A soft elevated shadow appears on hover to reinforce the lift: box-shadow: 0 8px 24px rgba(124, 58, 237, 0.25) (purple-tinted shadow, adjust to brand colour).
- Transition: transform 250ms ease, box-shadow 250ms ease.
- On hover-out (cursor leaves the card): the card returns smoothly to scale(1) and the shadow fades back to its resting state — same 250ms ease transition, reversed.
- Only the hovered card scales; sibling cards stay at scale(1) (no shrinking of other cards).
- transform-origin: center center / bottom center (so the card grows from its base, not floating upward oddly) — bottom center is recommended so the card feels grounded.
- cursor: pointer on the whole card.
- This hover behaviour applies identically to all 3 cards — Creator, Pro Creator, and Premium Creator all zoom the same way on hover.

10. “Become a Founding Creator” Section

REFERENCE: This section — the 'Become a Founding Creator' heading and the 6-card benefits grid (Early-Access to Creasume, Exclusive Founding Creator Badge, Lifetime Access to Premium Version, Priority Billing to Brands, Chance to Work with One or More Partners and Get Paid) — should use the same animation as the equivalent section on the Waitlist page. Reuse the Waitlist page's animation 1:1 (entrance direction, duration, easing, and any stagger between the 6 cards) rather than designing new motion for this block.

11. Founding Creator Application Form

Reference for the sections below: the Founding Creator Application form, the security/consent line, and the Frequently Asked Questions accordion.

Figure 4 — Founding Creator Application form and FAQ accordion

REFERENCE: The Founding Creator Application form (heading, input fields, 'Become a Founding Creator' submit button, and the avatar/security note row beneath it) should use the same animation as the equivalent form on the Waitlist page. Reuse the Waitlist page's animation 1:1 (entrance direction, duration, easing, and any stagger between the input fields) rather than designing new motion for this block.

12. Frequently Asked Questions — Accordion Behaviour

The FAQ section is an accordion: only one question can be open at a time. Clicking a question expands it to reveal the answer; clicking a different question closes the currently open one and opens the newly clicked one.

Accordion Logic

- Only ONE FAQ item can be expanded at any given time across the entire list.
- Clicking a closed question: that question expands and reveals its answer.

- Clicking a different question while one is already open: the currently open question closes (collapses), and the newly clicked question opens. This happens as one coordinated transition, not two separate unrelated actions.
- Clicking the currently open question again: it closes, leaving all questions collapsed (toggle-to-close is supported).
- State management: track a single 'activeIndex' (or null) rather than a boolean per item, so opening one item automatically guarantees only it is open.

Expand / Collapse Animation

- Use a height-based accordion transition, not a hard show/hide.
- Collapsed state: max-height: 0, opacity: 0, overflow: hidden on the answer container.
- Expanded state: max-height: [auto / measured content height], opacity: 1.
- Duration: 350ms.
- Easing: cubic-bezier(0.4, 0, 0.2, 1) — smooth ease-in-out, consistent for both expanding and collapsing.
- The chevron/plus icon on the right of each question rotates 180° (or 45° if it's a plus-to-cross icon) in sync with the expand/collapse, same 350ms duration.
- If using a JS framework, prefer measuring scrollHeight for max-height rather than a fixed px value, so answers of varying length animate correctly.
- The question row itself (the clickable header) does not move or resize — only the answer panel beneath it animates open/closed.

Hover / Click Affordance

- cursor: pointer on the full question row (not just the icon).
- On hover: subtle background tint change on the question row (e.g. background: rgba(255,255,255,0.03)), 150ms ease, to indicate it's clickable.
- No hover state needed on the answer text itself.

13. Global Rule — Scroll-Triggered Fade-In for All Text

Applies across the entire Landing Page

- Every text element on the landing page (headings, subtitles, paragraph copy, labels) should fade in as it scrolls into view, in addition to any section-specific animation already defined above.
- Default text fade: opacity: 0, translateY: +16px → opacity: 1, translateY: 0px.
- Duration: 500–600ms. Easing: cubic-bezier(0.22, 1, 0.36, 1).

- Trigger: IntersectionObserver, threshold 0.15, fires once per element when it enters the viewport. Does not replay on scroll back up.
- Where a section already has its own specific animation defined in this document (e.g. marquees, pricing pop-up, accordion), that section's specific animation takes priority — this global rule fills in any remaining plain text blocks not otherwise covered.
- For headings followed by a subtitle/paragraph, a small stagger (80–100ms) between the heading and the subtitle reads naturally, but is not mandatory if simpler to implement as a single combined fade.

Part 2 — Other Pages

The sections below cover standalone pages beyond the main landing page: How It Works, Desktop Login, Pricing, and Contact.

14. “How It Works” Page — Timeline Scroll Animation

The 'Steps to Connect' section (Connect your Instagram → Auto-Generate Identity → Customize your Profile → Share with Brands) should use the same timeline scroll animation as the 3-step process on the Waitlist page.

Figure 5 — How It Works page: consent bar, Steps to Connect timeline, security note, footer

REFERENCE: The 'Steps to Connect' vertical timeline (4 steps: Connect your Instagram, Auto-Generate Identity, Customize your Profile, Share with Brands, connected by the dotted vertical line with arrows) should use the exact same timeline scroll animation as the equivalent 3-step process on the Waitlist page. Reuse the Waitlist page's animation 1:1 — including how the connecting line/arrows draw themselves in sync with each step revealing, the entrance direction and stagger per step, and the icon animation for each step. This page has 4 steps instead of 3, so extend the same pattern to the additional step rather than changing the underlying animation logic.

Elements covered by this reference (for dev checklist)

- 'Your consent matters to us' bar at the top — entrance animation
- 'How It Works' heading + subtitle — fade in (per global text rule, Section 13)
- 'Steps to Connect' heading — fade in
- 4-step vertical timeline with connecting dotted line/arrows — timeline scroll animation matching Waitlist page's 3-step process

- Step icons (Instagram, Auto-Generate/lightning, Customize/pencil, Share/heart) — entrance animation in sync with each step's reveal
- Security/consent note + Creasume/Privacy buttons beneath the timeline — fade in
- Footer columns + 'START NOW — IT'S FREE' button — fade in

15. Desktop Login, Pricing, and Contact Pages — Light Scroll + Fade

These three pages are simpler, content-focused pages and should use a small, understated scroll effect with a fade — lighter and subtler than the more elaborate animations used on the main landing page.

Applies to: Desktop Login page, Pricing page, Contact page

- Each section/block on these pages fades in with a small upward scroll-slide as it enters the viewport — a lighter version of the global text fade rule (Section 13), applied to full content blocks rather than just text.
- Start state: opacity: 0, translateY: +12px (intentionally smaller offset than the main landing page's 16–20px, to keep the motion subtle on these utility-focused pages).
- End state: opacity: 1, translateY: 0px.
- Duration: 400ms (slightly shorter than landing page animations, for a snappier, less decorative feel).
- Easing: ease-out.
- Trigger: IntersectionObserver, threshold 0.15, fires once per block/section.
- No marquees, pop-ups, or complex motion on these pages — keep interactions minimal since these are functional pages (login form, pricing comparison, contact form) where clarity matters more than visual flourish.
- Form fields (on Login and Contact pages) can each fade in individually with a very small stagger (60–80ms apart) if there are multiple fields, otherwise the form can fade in as a single block.
